List of main symbols and abbreviations	12
Introduction	14
Chapter 1. Structural analysis of nonlinear vibratory machines with an electromagnetic drive	21
1.1. Classifications of the vibratory machines. Typical schemes and constructions of the electromagnetic drives	21
1.2. Static and dynamic models of electromagnetic vibration systems	26
1.3. Generalized structural scheme's and equations of motion of the electromagnetic vibration systems	33
1.4. Energy conversion in electromagnetic systems of the vibratory machines	37
1.5. Means of implementation the two-frequency and vibro-impact machines	42
1.5.1. Implementation of two-frequency resonant vibratory machines based on linear elastic characteristics	42
1.5.2. Implementation of vibro-impact resonant machines based on asymmetric piecewise linear elastic characteristics	48
1.6. The task of multi-criteria analysis of the resonant vibratory systems	56
1.6.1. Production of optimization problems. Selection the criteria of optimization	56
1.6.2. Criteria for evaluating the efficiency of vibration machines	60
1.7. Ways to take account of technological load	65
Conclusions of the Chapter 1. Research problems	67
Chapter 2. Parametric synthesis of the resonant vibration systems with linear and piecewise linear elastic characteristics	69
2.1. Synthesis of the three-mass (two-frequency) vibration systems with multiple major natural frequencies	69
2.1.1. Frequency synthesis of the three-mass vibratory system	69
2.1.2. Synthesis of elastic parameters during the upgrading of single frequency (two-mass) resonant machines	74
2.1.3. Synthesis of the two-frequency vibratory system with basic hardness elastic characteristics	75
2.2. Synthesis of the vibro-impact resonant systems with piecewise linear elastic characteristics	77
2.2.1. Parametric synthesis of the two-mass vibratory systems with asymmetric elastic characteristics of the main parts of the phased integration method	77

2.2.2. Synthesis of asymmetrical elastic characteristics with gap	82
2.3. Force-frequency analysis of the elastic rod system with asymmetric characteristic by finite element method	84
2.3.1. Frequency analysis	85
2.3.2. Force analysis	91
Conclusions of the Chapter 2	107
Chapter 3. Dynamic analysis of nonlinear resonance vibration machines with linear elastic properties	109
3.1. The influence of the nonlinearity of the electromagnetic drive to amplitude-frequency characteristics of vibration machines	109
3.2. Analysis of energy transformations in vibration systems with electromagnetic drive	116
3.3. Dynamic analysis of the two-frequency (three-mass) vibration systems with linear elastic characteristics and independent electromagnetic drive	120
3.3.1. Implementation of the two-frequency resonant modes	120
3.3.2. Dynamic analysis at the single-frequency disturbance	124
3.3.3. Impact phase to acceleration of harmonious composition of the working masses	128
3.3.4. Synthesis of optimal force parameters	128
3.4. Rational synthesis of the two-frequency resonance vibration systems for the modernization of harmonic resonance machines	131
Conclusions of the Chapter 3	136
Chapter 4. Dynamic analysis of the vibro-impact resonant machines with piecewise linear elastic characteristics	137
4.1. Dynamics of vibro-impact (two-mass) machines with piecewise linear elastic properties	137
4.1.1. Optimization synthesis of two-mass vibration system with piecewise linear elastic characteristic without gap	138
4.1.2. Substantiation the use of pulse drive in vibro-impact systems.....	142
4.1.3. Effect of preloading the resilient characteristics to the dynamics of the system	147
4.1.4. Vibro-impact system with a gap in elastic characteristic	148
4.2. Parametric synthesis and analysis of the three-mass vibro-impact system	153
4.3. Comparative multi-criteria analysis of the resonant vibration systems	164
4.4. Synthesis of vibro-impact system with technological limitations	173
4.5. Synthesis the main and subharmonic modes of vibro-impact systems	184

4.6. Dynamic stability of vibro-impact systems	200
Conclusions of the Section 4	207
Chapter V. Optimization tasks in the design of vibration systems	209
5.1. Optimal discrete-continuous rod system	209
5.1.1. Unconditional optimization of rod systems based on frequency-mass criterion	210
5.1.2. Conditional optimization of rod systems. Calculation of optimal rod discrete-continuous systems	213
5.2. Optimization of mass-frequency characteristics of vibration machines working body	218
5.2.1. Optimization of design parameters of working body by application module CosmosWorks in SolidWorks	220
5.2.2. Optimization of design parameters of working bodies of vibration machine by frequencies-mass criteria	227
5.2.3. Optimization of design parameters of elastic elements on the value of own frequencies	232
Conclusions of the Chapter 5	238
Chapter 6. Applied research and development of vibrating machines	239
6.1. The design of the two-frequency resonance vibration platform for consolidation of concrete	239
6.2. The design of standardized modules of resonant vibration machines	248
6.3. Modernization of the vibration table with electromagnetic drive	260
6.4. Comparative evaluation of the efficiency of the pulse resonant vibration machines	270
6.5. Experimental studies of the two-mass vibration module with pulsed electromagnetic drive	274
Summary of conclusions and practical recommendations on the use of results	283
Reference	285
Summary	301
